

Who are we?

We are a group of concerned parents aiming to educate people about the Human Papillomavirus (HPV) vaccination.

We do this purely and solely with your daughters' best interests at heart.

Our aim

To encourage parents to conduct research in order to make an informed decision about whether to consent to HPV vaccine administration to their children.

Thousands of girls world-wide are suffering from post-vaccine disorders.

We ask you to please read and consider the information in this leaflet, which is drawn from published sources as referenced below.

Consider
Before
Consent

Some important
information
about the
HPV vaccine

Consider Before Consent

Please consider the following information about the HPV vaccine - before giving your consent

What is the HPV vaccine?

This is offered to prevent infection by some strains of the sexually-transmitted Human Papillomavirus (HPV), which may cause cervical cancer in the future. It is administered to year 8 girls (aged 12/13) by a course of 2 injections over the year.

Worldwide Reports about the HPV vaccine:

- ♦ Health authorities in Japan have stopped recommending HPV vaccines.
- ♦ Denmark now has 5 centres for assessing and treating girls with adverse reactions. They estimate that 1 per 500 HPV vaccinated girls are attending.⁵
- ♦ There are lawsuits pending in France, India and Spain.⁹
- ♦ The European Medicines Agency is commencing a review into reported side effects.

The issues:

- ♦ Gardasil™ contains toxins such as aluminium which can be harmful to the nervous system.⁷ The package insert states that you should not have the vaccine if you are hypersensitive to yeast.¹
Is your daughter yeast-sensitive? Ask how doctors check for possible reactions to this and aluminium.
- ♦ Of the adverse events reported post-vaccine, illnesses include ^{1,2,3,4,8,10}:
 - ♦ Guillain-Barré Syndrome, Acute Disseminated Encephalomyelitis (ADEM)
 - ♦ Premature menopause, chronic pain in limbs;
 - ♦ Severe headaches, excessive fatigue, dizziness;
 - ♦ Gastro-intestinal problems;
 - ♦ Seizures, cognitive dysfunction;
 - ♦ Multiple Sclerosis; Rheumatoid arthritis;
 - ♦ Irritability, sleep problems, skin rashes and hives.

In fact the manufacturer reports 3.3% of vaccinated girls experienced conditions potentially indicative of autoimmune disorders, and 2.5% reported serious adverse reactions after receiving Gardasil.¹

- ♦ We have yet to find any formal procedures for assessing and diagnosing post-vaccine illnesses. Symptoms can take months to appear and most families are unlikely to report symptoms to the MHRA. Therefore the numbers of girls affected is likely to be far higher than officially reported.

- ♦ It is not even proven that the vaccine works long term⁶ - or that it can actually prevent cervical cancer.⁴ Furthermore, there are safe and effective alternatives to vaccination, such as regular pap screening.
- ♦ Over **8000** reports of side effects following the HPV vaccine have been reported to the authorities in the UK alone. Of that, over 2000 are recorded as SERIOUS.² - *Are these acceptable risks?*

DRUG REACTIONS

Total number of UK spontaneous suspected adverse drug reaction (ADR) reports in association with [routine immunisation] vaccines between 1/1/05 and 22/4/15

Diphtheria, tetanus, pertussis, polio and haemophilus influenza type B	1,309
Tetanus, diphtheria and polio	1,076
Diphtheria, tetanus, pertussis and polio	1,190
Rotavirus (Rotarix)	412
Pneumococcal disease (OCV)	1,560
Meningococcal group C disease (Men C)	769
Haemophilus influenza type B /Meningitis C	279
Measles, mumps and rubella (MMR)	1,594
Pneumococcal disease (PPV)	963
Fluenz Tetra	872
Shingles (Zostavax)	626
Human papillomavirus (HPV)	8,228
Influenza virus	2,994
